

NEA WP3b: Coastal and Marine Ecosystems

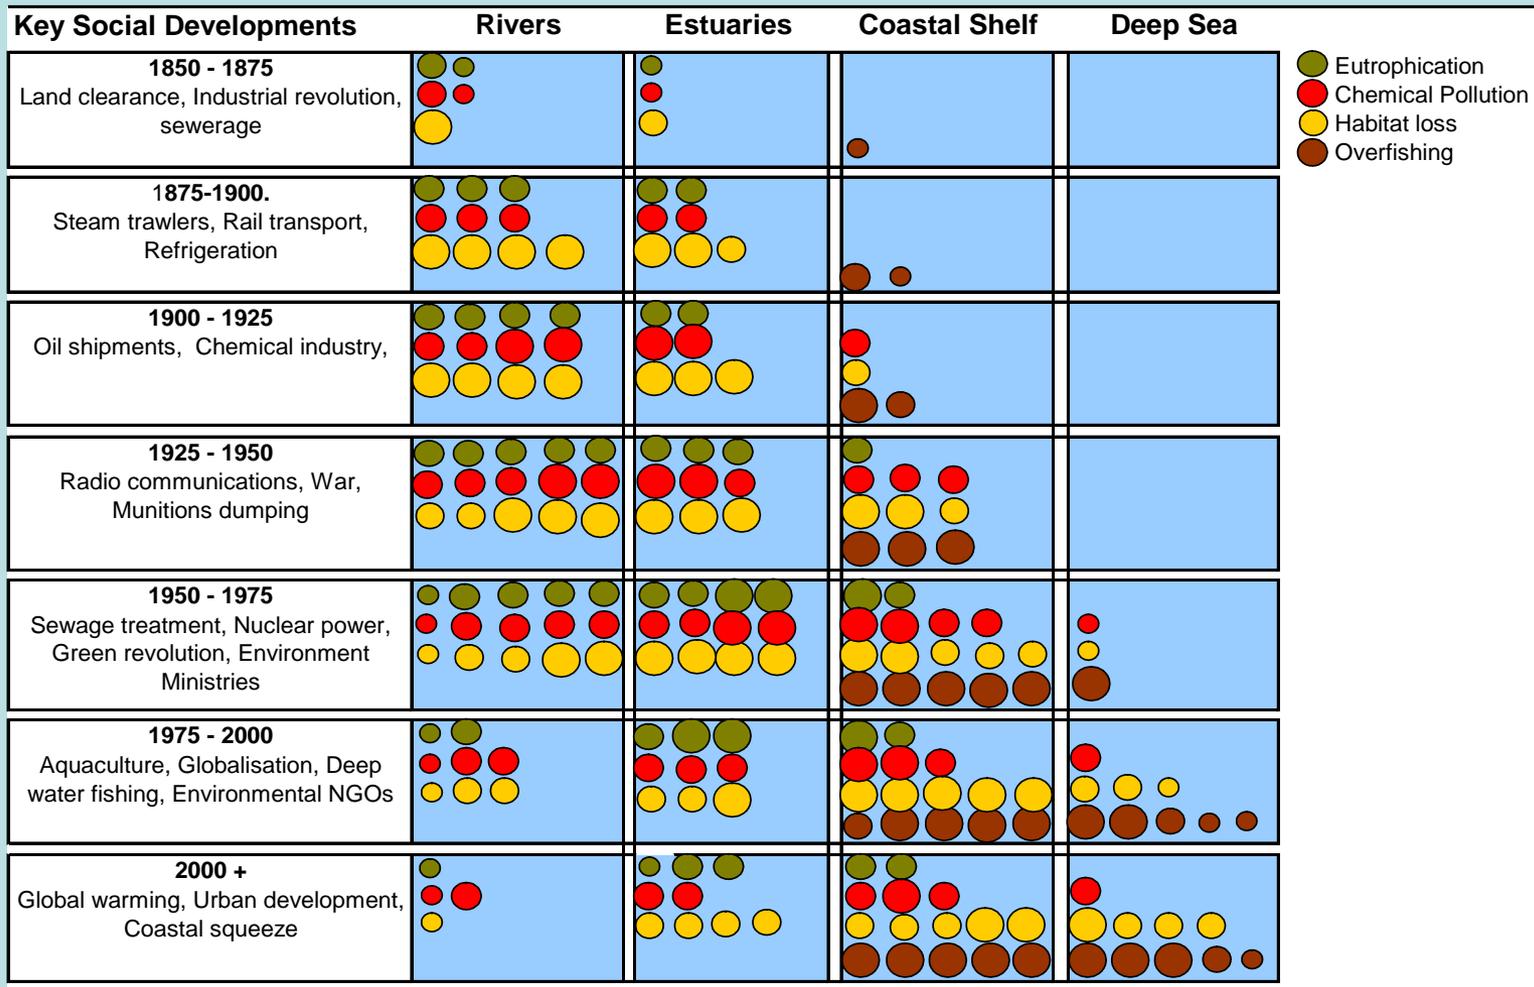

Lead PIs:

*Kerry Turner (UEA),
Laurence Mee (SAMS),
Mike Elliott (HULL)*

A complex social-ecological system

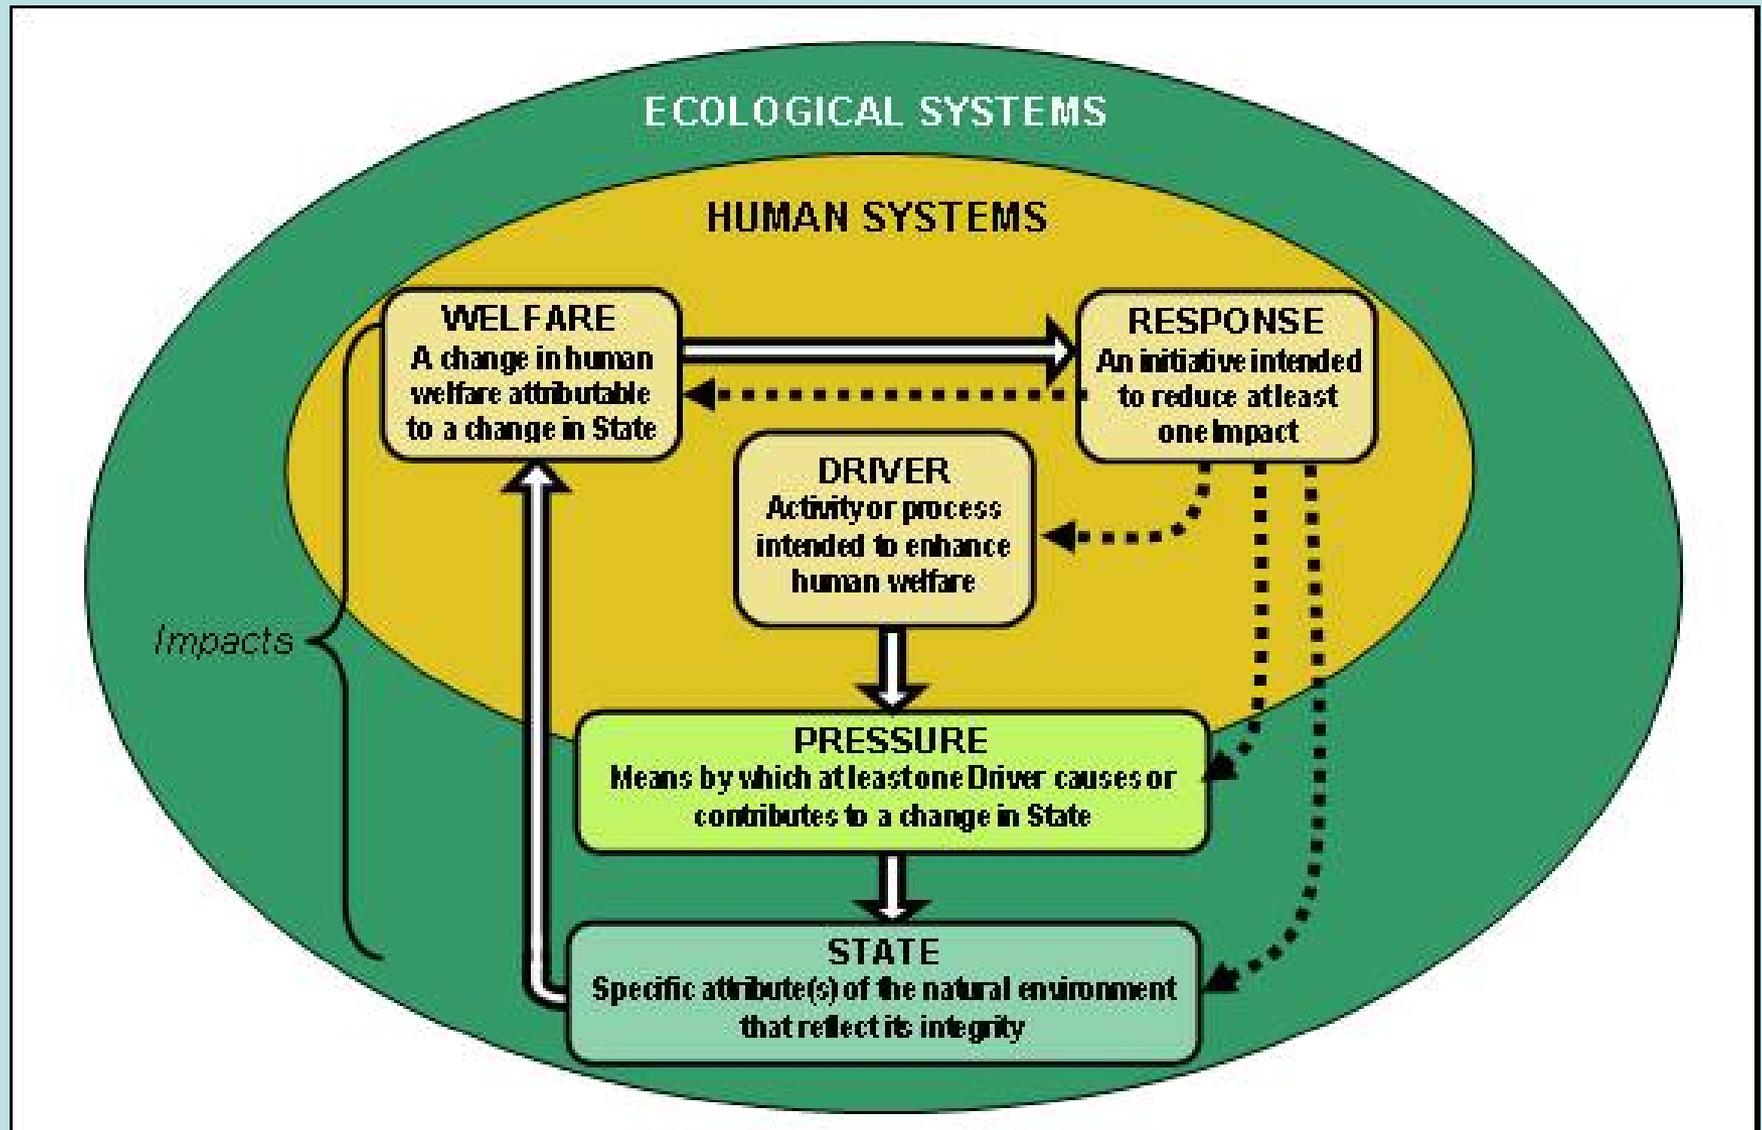

The UK's Growing Marine Footprint

In 1858, so much sewage poured into the River Thames in London that MPs could not work in the Houses of Parliament because of the smell.

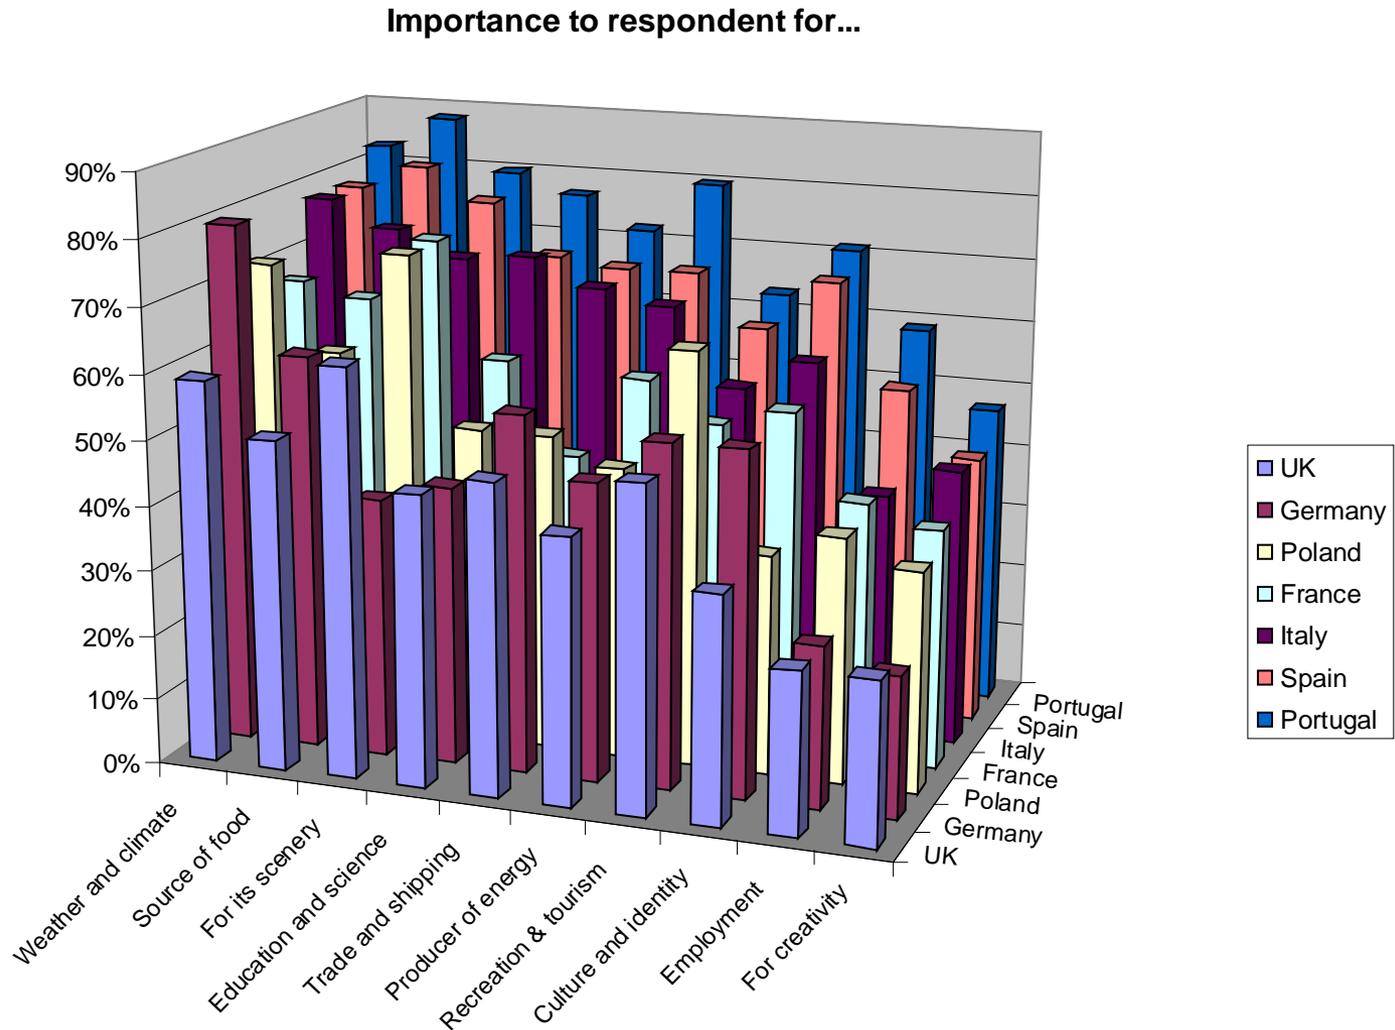

DPSWR

Value conflicts

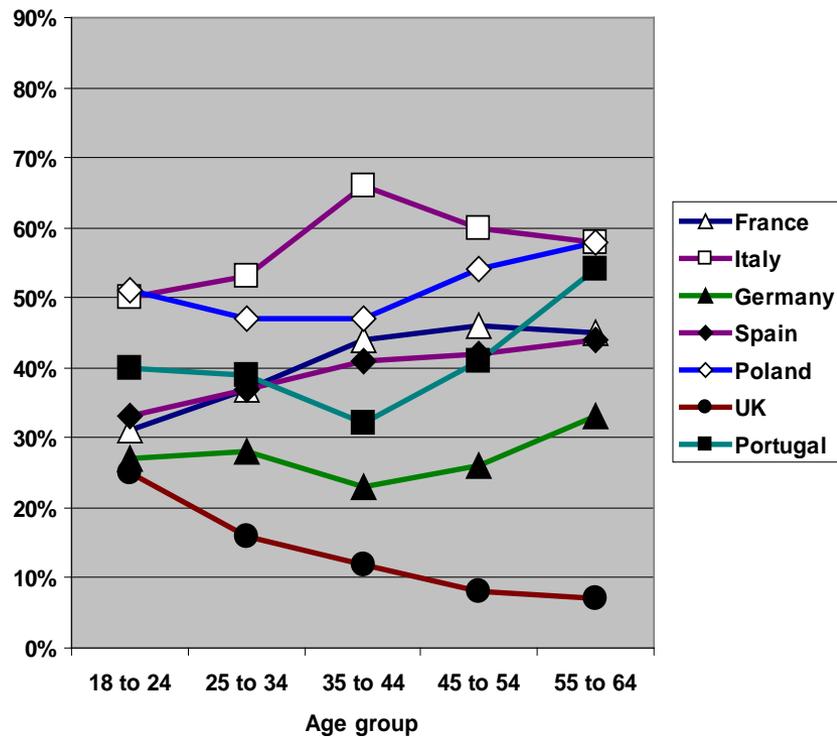

Values and worldviews

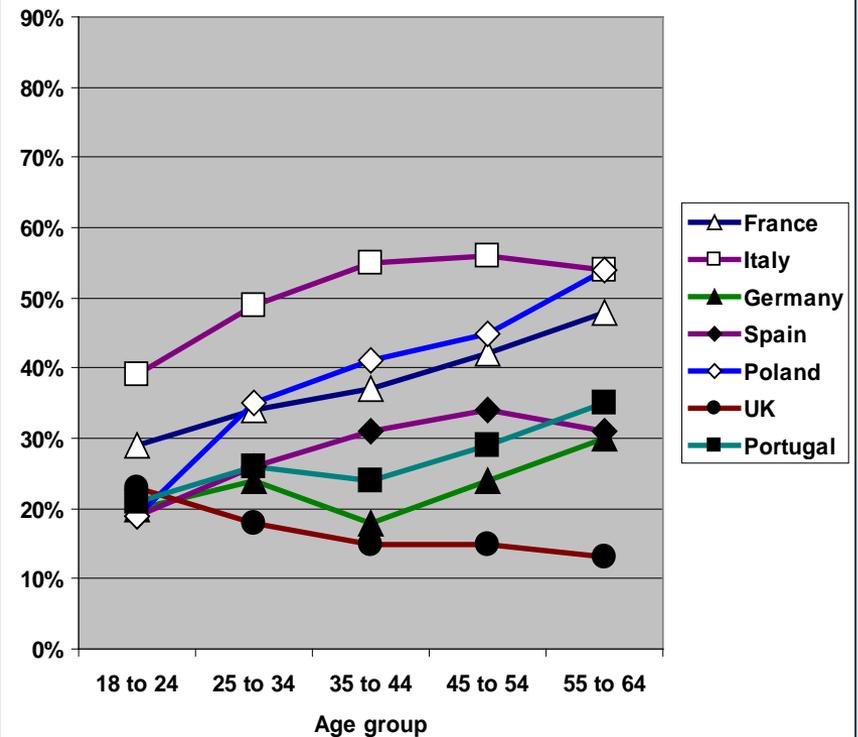

1. Building trust in institutions (1)

The EU is competent to manage and protect the ocean environment

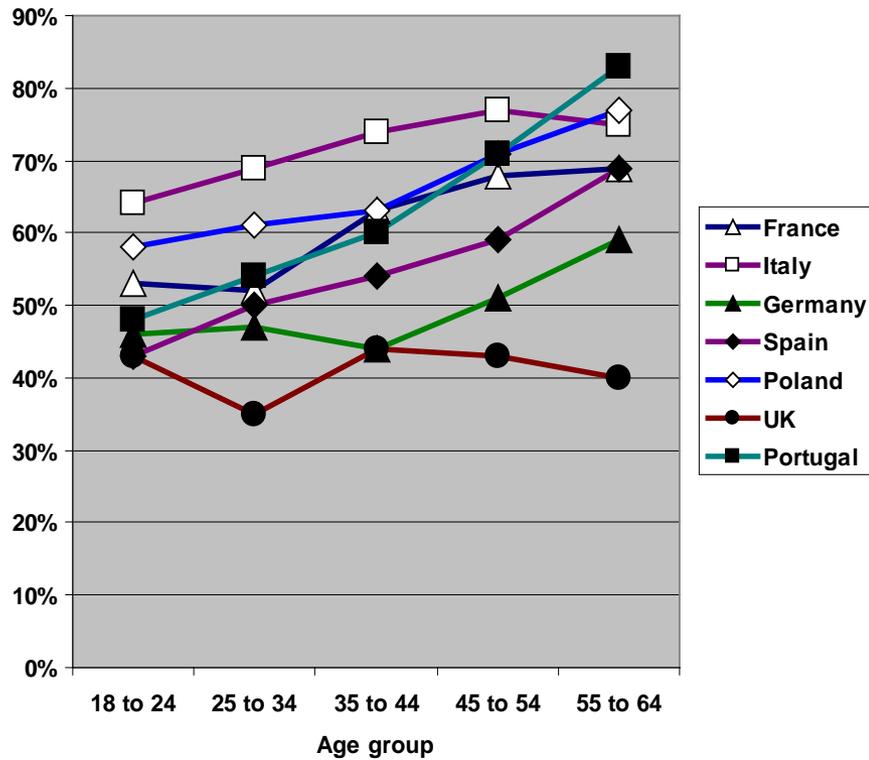

National governments are competent to manage and protect the ocean environment

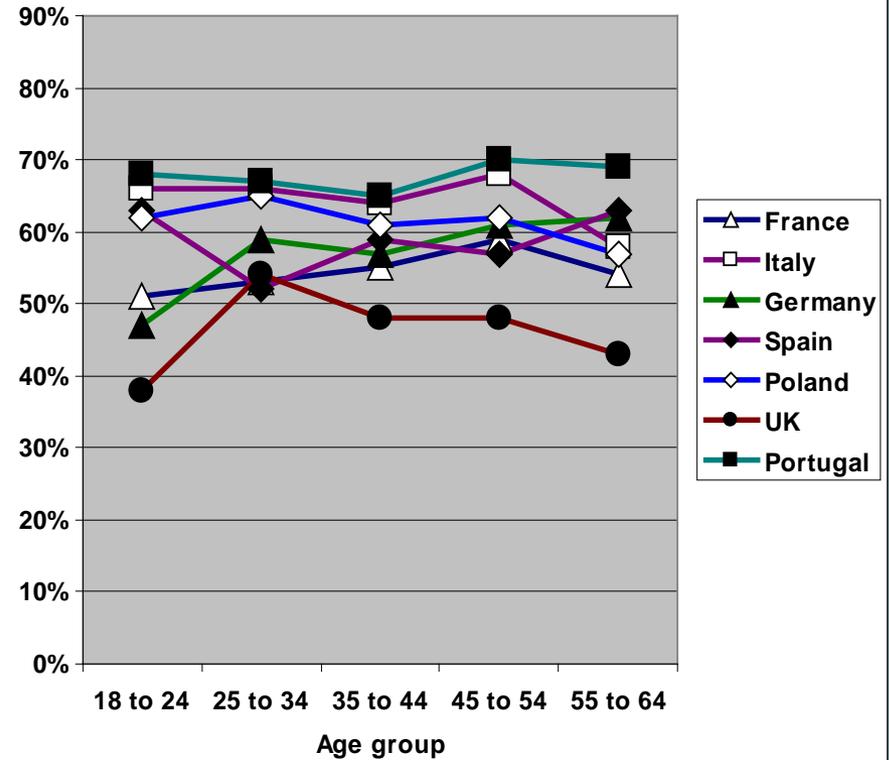

Building trust in institutions (2)

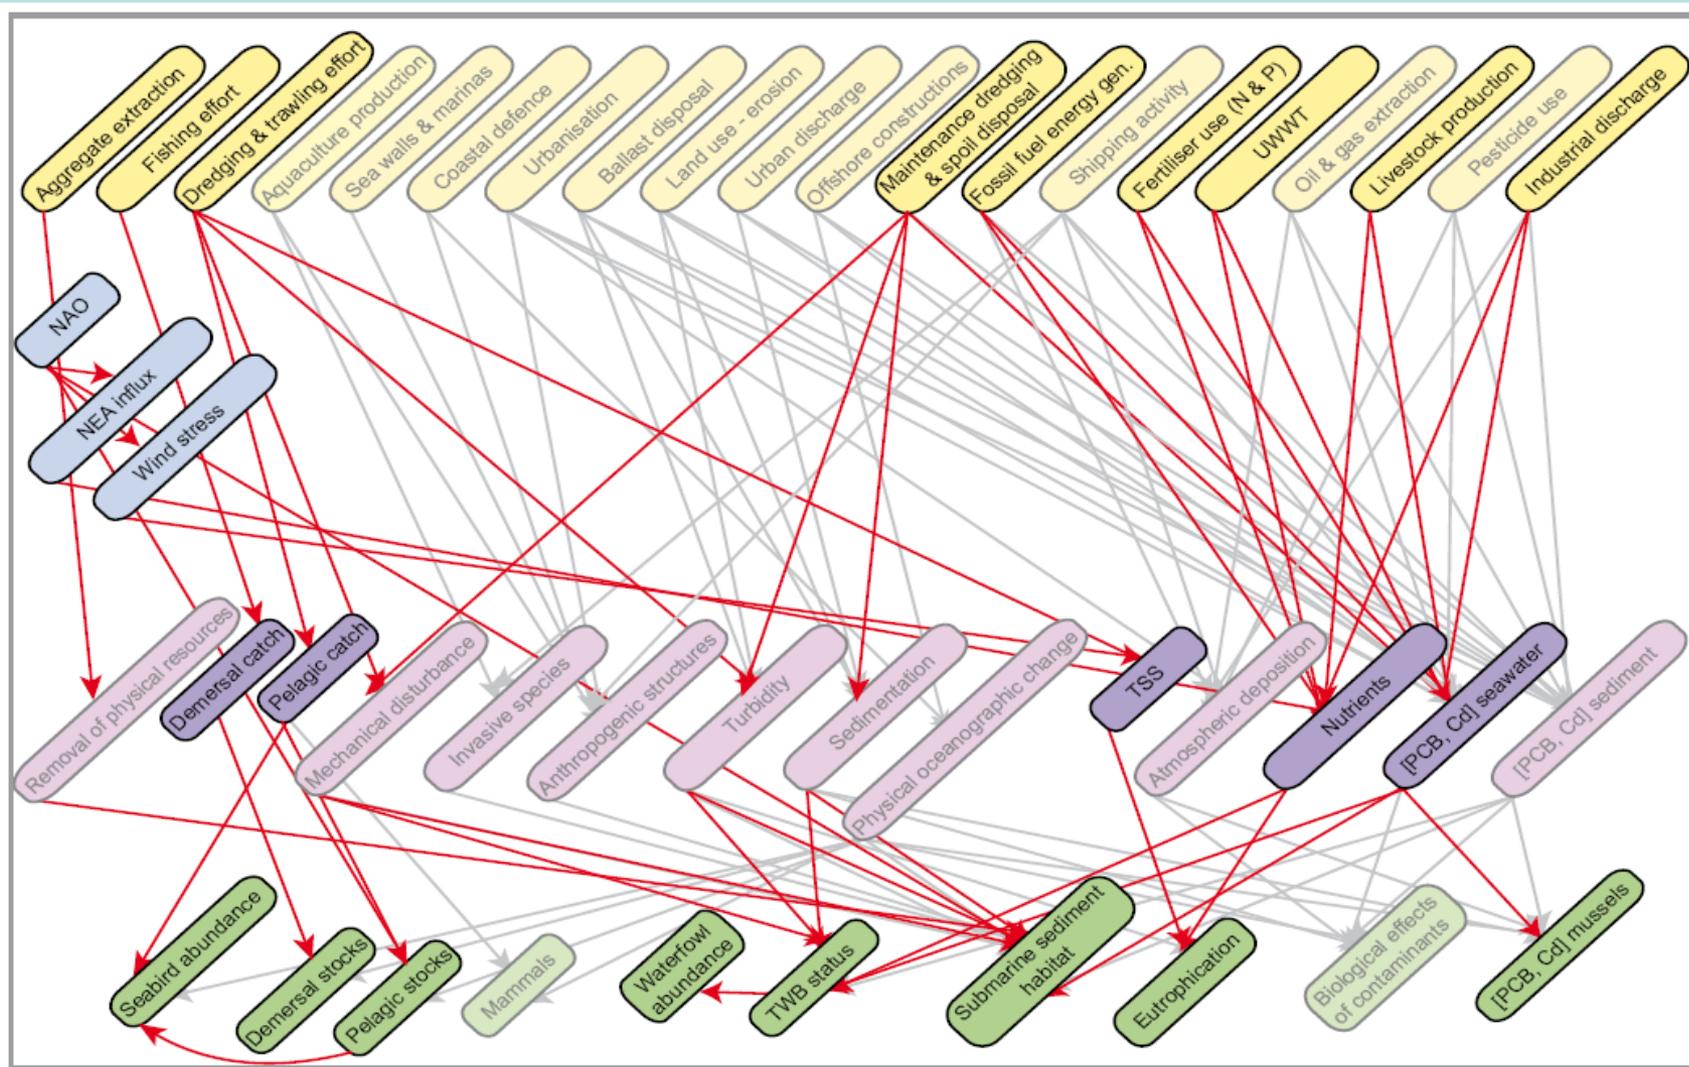

Scientific organisations are competent to manage and protect the ocean environment

Environmental groups are competent to manage and protect the ocean environment

North Sea conceptual model

North Sea Winners and Losers

Winners

- Winners include phytoplankton and trophic dead-end species such as jellyfish

- Winners also include transitional waters (estuaries)

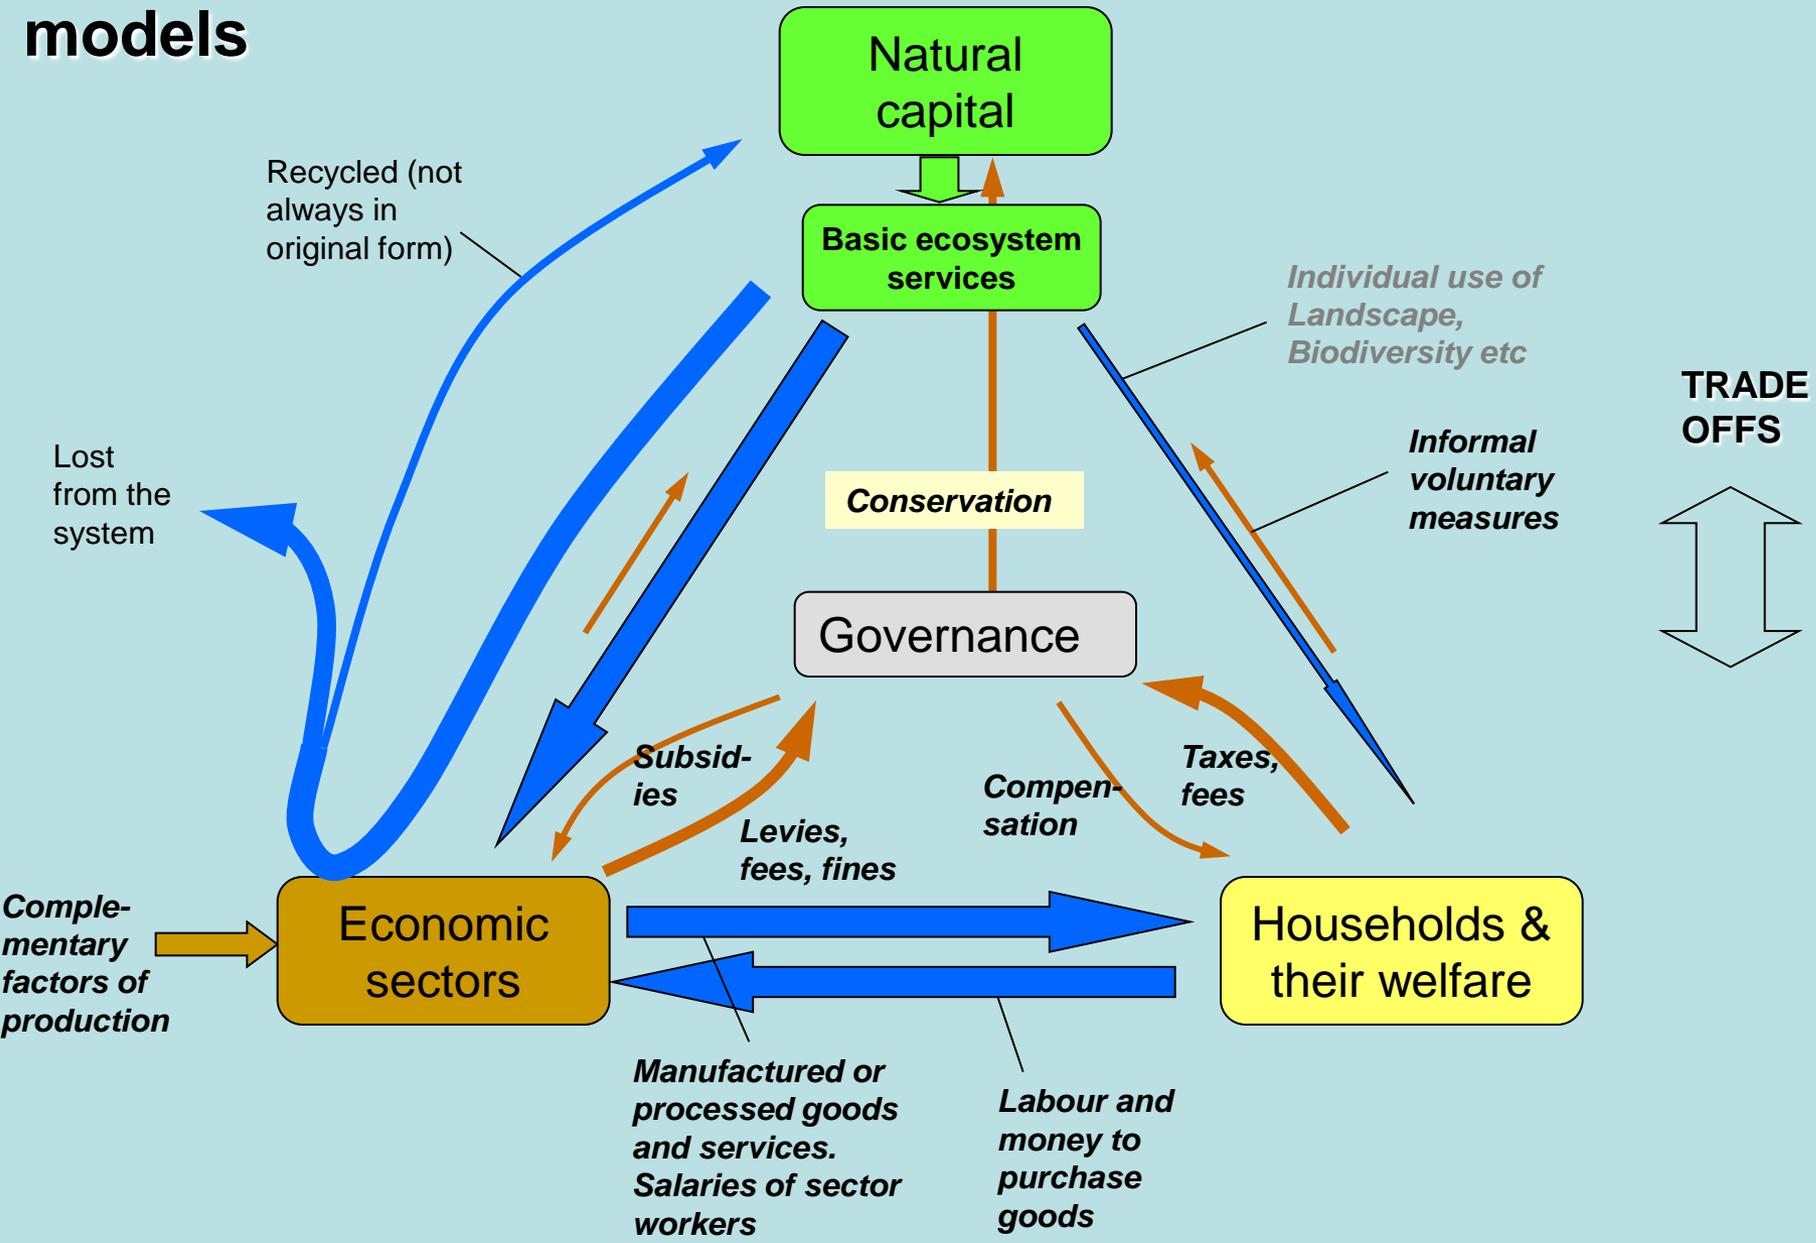

- Losers comprise seabirds that depend on sand eels and small pelagic fish.

- Bottom water (demersal) fish species such as plaice, cod and haddock are losers as are the other animals and plants that form sea-bed habitats

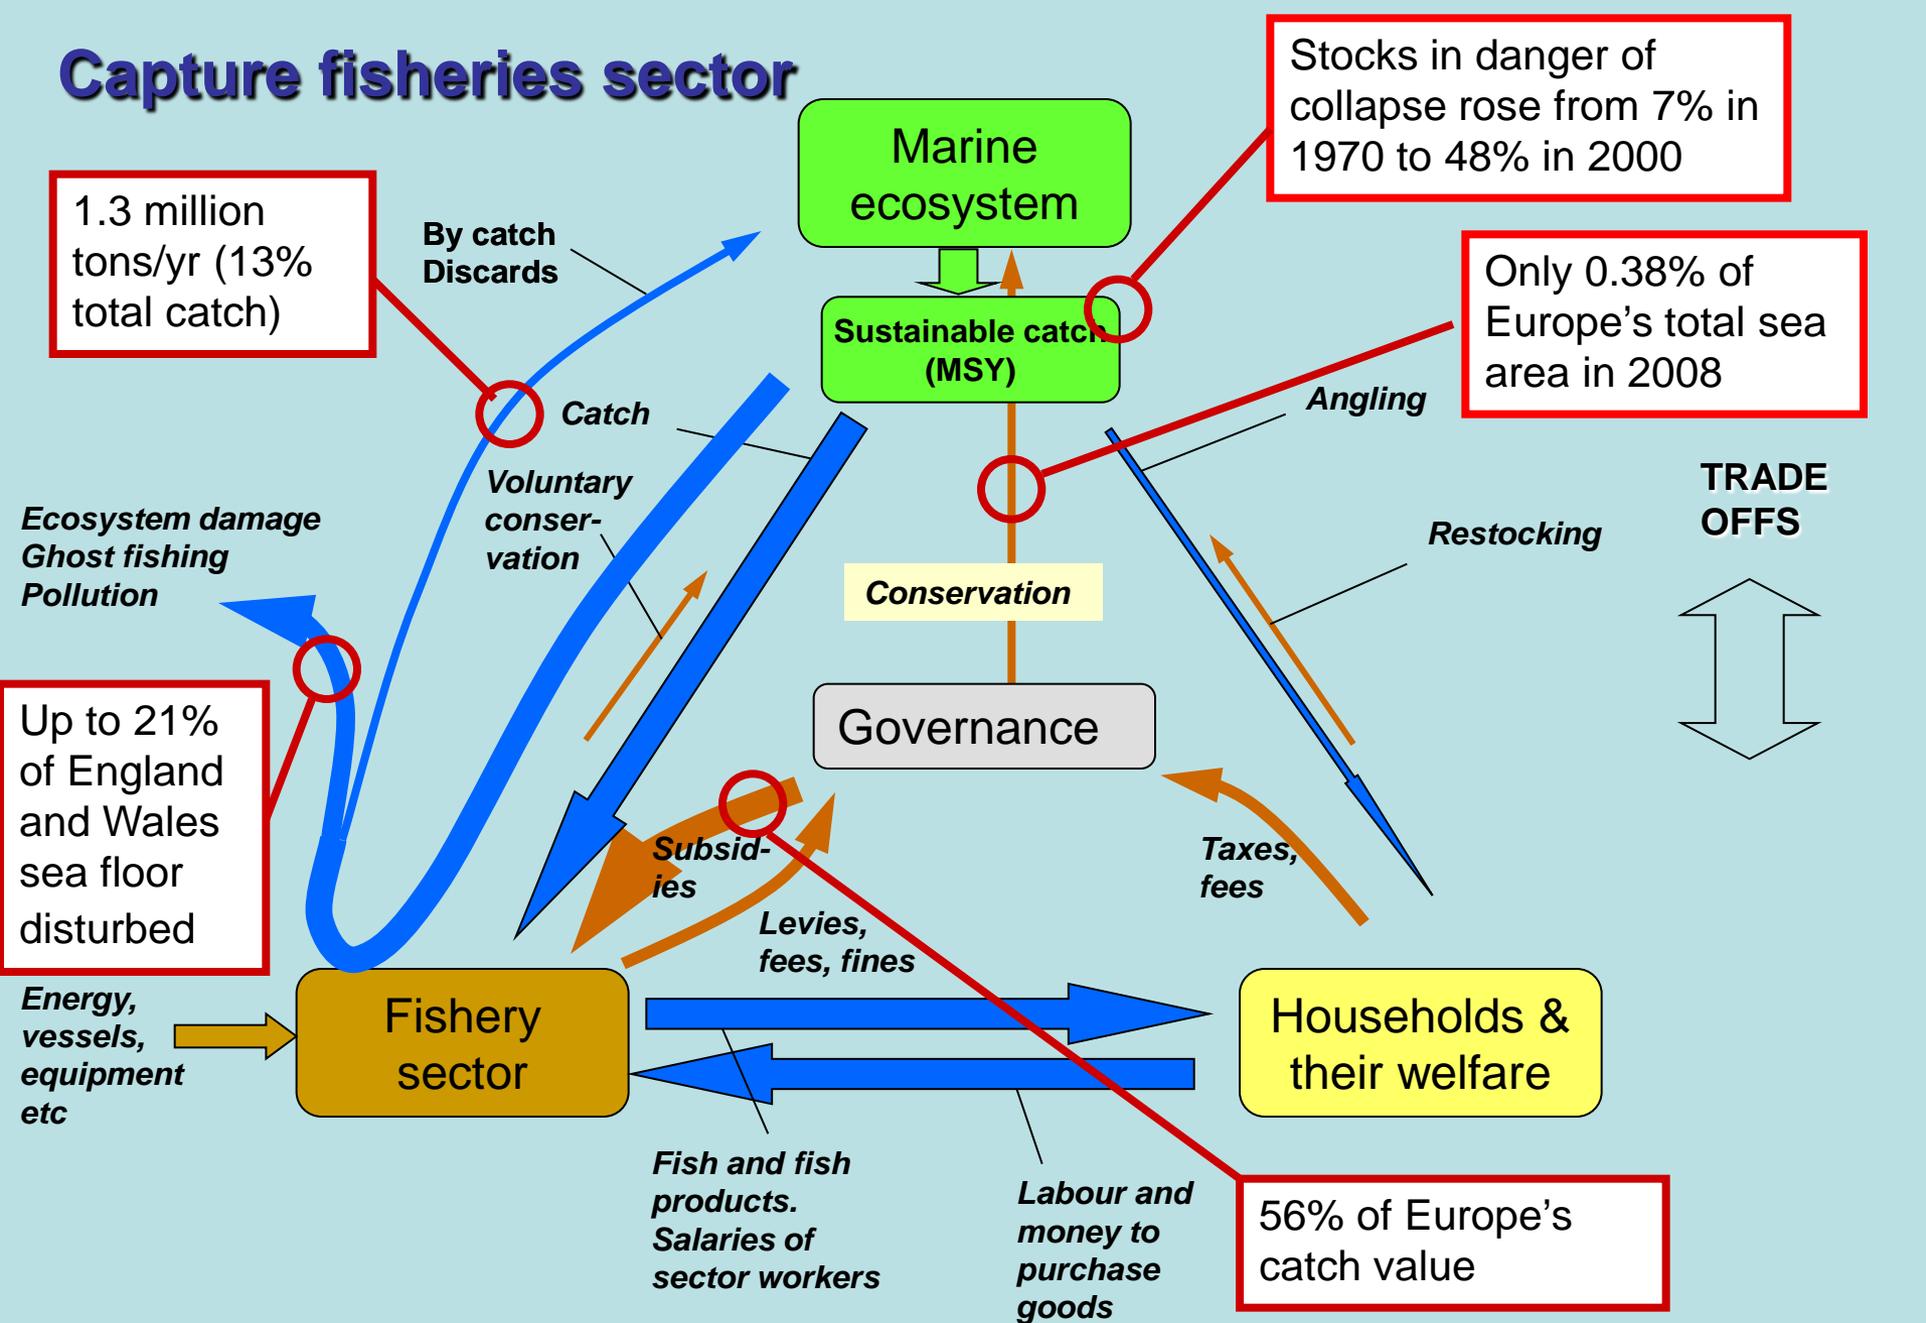

Losers

Stock and flow models

Capture fisheries sector

Objectives

- Review of coastal/marine ecosystem services and values, organised in a conceptual framework adapted to the spatial and other factors relevant to coastal/marine environments.
- An appropriate marine futures scenarios framework (collaboration with WP6);
- Feasibility of ‘coupled’ modelling of environmental change and impacts on ecosystem services across the coastal continuum.

Component 1 - UEA

- Literature review- covering coastal/marine ecosystem services provision, health status and valuation, up to the global scale but with a particular focus on the UK (to complement WP2a).
- Analysis to identify spatially explicit provision of ecosystem services within the catchment-coastal continuum.
- Comparative analysis of the alternative ecosystem services valuation classification systems and approaches.

Component 2 - SAMS

- Futures scenarios framework formulation-
global scale worldviews with a more
detailed focus on a regional sea scale.
- Implementation of futures scenarios
exercise

Component 3 – U of Hull

- Review of the available models and approaches necessary to provide a ‘coupled’ modelling assessment of environmental change (land use change modelling) in catchments and the ecosystem services impacts through estuaries and into coastal waters. This work will involve joint discussions with WP2a.
- Detailed exploration of catchment/estuary/coastal waters ecosystem services provision under environmental change conditions.

Deliverables

- From SAMS : Scenario analysis report (draft and final); report contribution to the case study modelling exercise.
- From Hull : Report on ecosystem services within the coastal continuum (draft and final); report contribution to the case study modelling exercise.
- From UEA : Literature review for marine /coastal ecosystem services and values; case study report; draft and final chapter report.
